Numpy and OpenCV

Dr Frazer Noble

Introduction

In this presentation, I will describe:

• Basic operations using NumPy and OpenCV.

Requirements

To follow along with this tutorial, you will need the following tools:

- Python 3.8.6.
- Visual Studio Code 1.53.1.

You will also need to install the following Python packages:

- OpenCV.
- NumPy.

It is assumed that you are using Windows; however, these instructions should be easily adapted to Linux.

Getting Started

Open Visual Studio Code. To open the app: Open the Start menu, type Visual Studio Code, and then select the app.

Open the Explorer tab. To display the tab: Left click View > Explorer or press ctrl + Shift + E. This will display the Explorer tab.

Left click on the Open Folder button. This will display the Open Folder prompt. Browse to the following directory:

C:/Users/%USER%/Documents

Note: Replace %USER% with your own username. My username is fknoble; hence, the path is C:/Users/fknoble/Documents.

In C:/Users/%USER%/Documents create a new folder named opencv_01. To create a new folder: Right click in the Explorer tab, left click New Folder, and rename it.

In C:/Users/%USER%/Documents/opencv_01 create a new file named mat.py . To create a new file: Right click on /opencv_01 in the Explorer tab, left click New File , and rename it. The file will open automatically.

/opencv_01 should contain the following files and folders:

/opencv_01
 mat.py

mat.py

Type the following code into mat.py:

```
import cv2 as cv
import numpy as np
```

OpenCV's Python module cv2 is imported as cv and NumPy's Python module numpy is imported as np .

```
def main():
    img = np.zeros((480, 640, 1), dtype=np.uint8)
    cv.rectangle(img, (100, 100), (400, 400), 255, -1)
    cv.imshow("img", img)
    cv.waitKey(1)
```

This begins main() 's definition. zeros() creates a 480 x 640 x 1 array of 0's and assigns it to array img. A filled rectangle is drawn on the img. The array is then displayed in the img window.

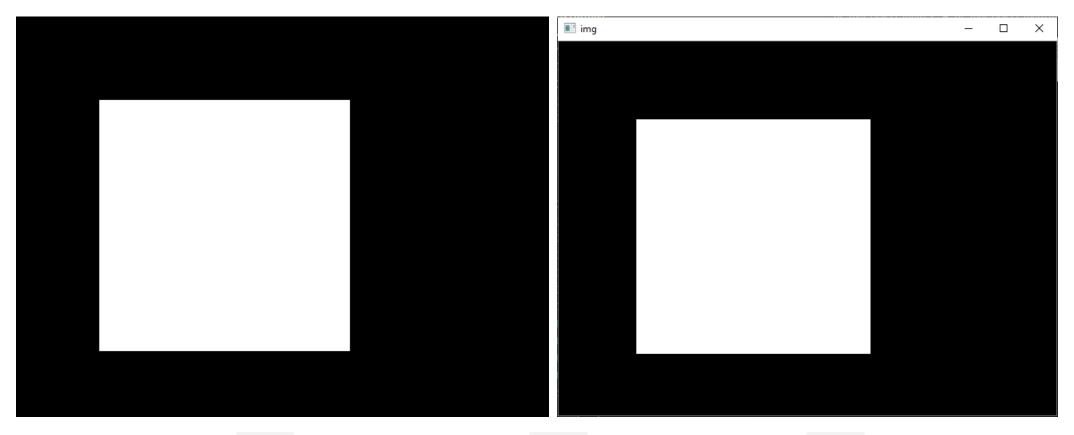

Figure: (Left) The img array; and (Right) img displayed in the img window.

```
background_img_1 = np.zeros((480, 640, 1), dtype=np.uint8)
background_img_2 = np.zeros((480, 640, 1), dtype=np.uint8)

cv.rectangle(background_img_1, (150, 150,), (350, 350), 255, -1)
cv.rectangle(background_img_2, (200, 200,), (450, 450), 255, -1)

background_img = background_img_1 + background_img_2

cv.imshow("background_img", background_img)
cv.waitKey(1)
```

zeros() creates a two arrays of 0's and assigns them to arrays background_img_1 and background_img_2. Filled rectangles are drawn on them. The arrays are added together and the result is assigned to background_img The array is then displayed in the background_img window.

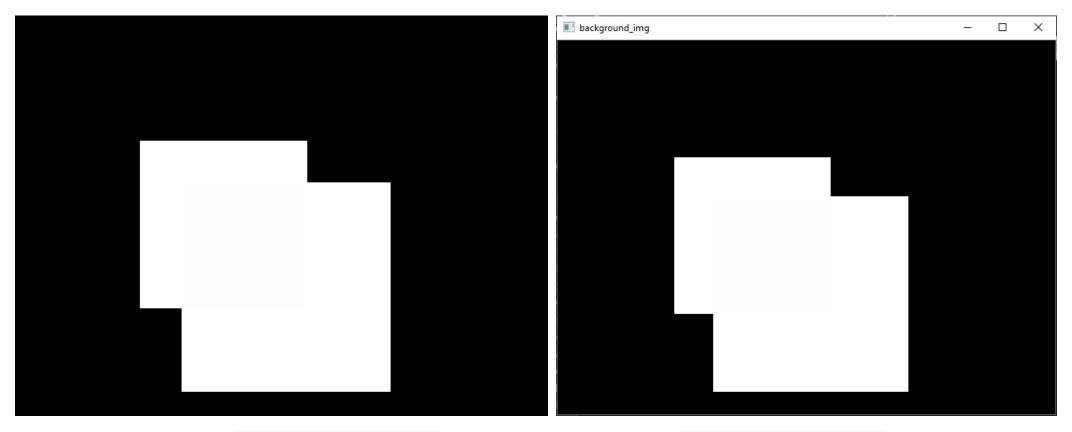

Figure: (Left) The background_img array; and (Right) background_img displayed in the background_img window.

```
sub_img = img - background_img

cv.imshow("sub_img", sub_img)
cv.waitKey(0)

cv.destroyAllWindows()

return 0
```

background_img is subtracted from img and the result assigned to array sub_img. The array is then displayed in the sub_img window. main() waits for user input before destroying all windows.

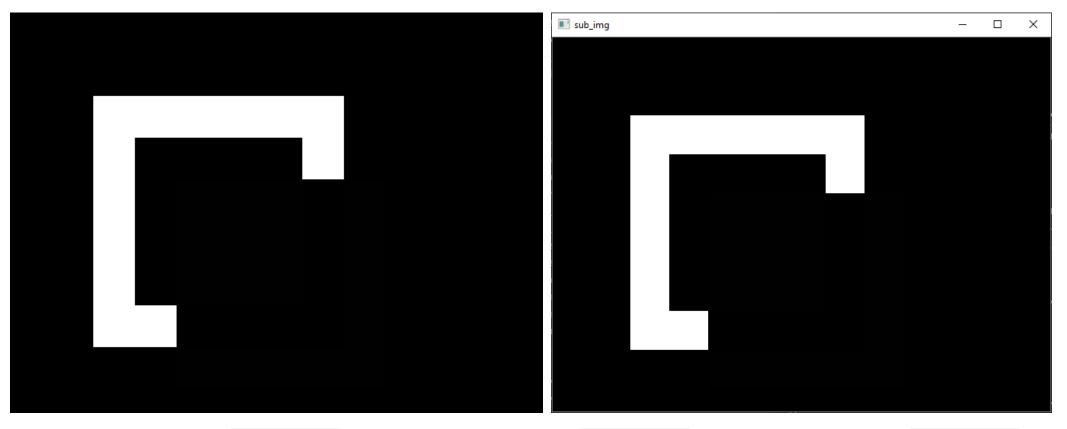

Figure: (Left) The sub_img array; and (Right) sub_img displayed in the sub_img window.

```
if __name__ == '__main__':
    main()
```

main() will be called when the mat.py is run.

Run mat.py

Open a new terminal in Visual Studio Code. To open a new terminal: Left click View > Terminal or press ctrl + \cdot.

Type the following commands into the terminal and then press ever after each one:

```
cd ./opencv_01
python mat.py
```

This will change the current directory to the <code>/opencv_01</code> sub-directory and then run <code>mat.py</code> .

Press any key to close the windows and stop mat.py.

Conclusion

In this presentation, I have described:

• Basic operations using NumPy and OpenCV.
